Please search the following as soon as possible for application with serial number 09/995,587

SEQ ID NO: 2 and 10 against all commercial nucleic acid databases including issued patents database and pending application database and provide a print of all results.

SEQ ID NO:1 and 11, against all commercial protein databases including issued patents database and pending application database and provide a print of all results.

If y u have any questions please call me at the above phone number.

**Thanks** 

Manjunath N. Rao, Ph.D. Biotechnology Patent Examiner Art Unit 1652, Room 10A11 Crystal Mall 1, USPTO. SEP 16 2002

No 100 % or 65-100% matches for both DNA Sproken No matches for 15. a a regment was found.

JQ0802 Levansucrase (EC 2.4.1.10) precursor - Bacillus amyloliquefaciens
RNAlternate names: 2,6-beta-D-fructan-6-beta-D-fructosyltransferase; sucrose
C; Species: Bacillus amyloliquefaciens
C; Species: Bacillus amyloliquefaciens
C; Accession: JQ0802; S11739
R; Tang, L.B.; Lenstra, R.; Borchert, T.V.; Nagarajan, V.
Gene 96, 89-39; 1990
A; Title: Isolation and characterization of levansucrase-encoding gene from Bacillus
A; Reference number: JQ0802; MUID:91092506
A; Mcference number: JQ0802; MUID:91092506
A; Residues: 1-472 <-TAN>
A; Residues: 1-472 <-TAN>
A; Experimental source: ATCC 23844
A; Experimental source: ATCC 23844

## ALIGNMENTS

Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder. Novel human diagnostic protein #21642. ABG21651 standard; Protein; 881 AA. Tang YT; 30-MAR-2001; 2001WO-US08631. 31-MAR-2000; 2000US-0540217 23-AUG-2000; 2000US-0649167 18-FEB-2002 (first entry) Drmanac RT, Liu C, (HYSE-) HYSEQ INC.

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving cuantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical disorders involving partners are useful in medical cuantitating a polypeptide in protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in capponshible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic maino acid sequences of the invention.

Consideration, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             30;

The invention relates to isolate polynucleotide (1) and the propertied (II) sequences. (I) is useful as hybridisation probes, and propertied (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The cand gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags (II) is useful in gene therapy techniques (II) is useful for generating antibodies against it, detecting or fountitating a polypeptide in tissue, as molecular weight markers and as imaging of sites expressing (II). (I) are useful in medical disorders involving aberrant protein expression or biological activity. (I) and (II) are useful in medical consorters, forensics, gene mapping, identification of mutations in responsible for genetic disorders or other traits to assess biodiversity amino acid sequences ABG00010-ABG30377 represent novel human consideration, but was obtained in electronic format directly from WIPO at the using interval in electronic format directly from WIPO

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, complypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PER) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The man apply and in recombinant production of (III). The collymucleotides are also used in diagnostics as expressed sequence tags of for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or trot treat disease states involving content of the collyment. (II) and its binding partners are useful in medical activity of sites expressing (II). (I) and its binding partners are useful in medical disorders involving aberrant protein expression or biological activity. Crep polypeptide and polynucleotide sequences have applications in capponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and amino acid sequences. ABG00010-ABG30377 represent novel human

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, collypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The collynucleotides are also used in diagnostics as expressed sequence tags contentially dentifying expressed genes. (I) is useful in gene therapy techniques (I). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as imaging of sites expressing (II). (I) are useful for treating antibodies against it, detecting or food supplement. (II) and its binding partners are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences of the invention.

C diagnostic amino acid sequences of the invention.

C diagnostic amino acid sequences of the invention.

Specification, but was obtained in electronic format directly from WIPO

polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The configuration of configuration of configuration are also used in diagnostics as expressed sequence tags of reference normal activity of (II) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. Consolides in mapping, identification of mutations and to produce other types of data and products dependent on DNA and configuration expression or biological activity. Consolide for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences of the invention.

Configuration, but was obtained in electronic format directly from WIPO xxx

The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, collypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The collynuclectides are also used in diagnostics as expressed sequence tags correspond activity of (II) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or constructivity of (II) or to treat disease states involving considers involving antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in the polypeptide and polynuclectide sequences have applications in cresponsible for generic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and to produce other types of data and products dependent on DNA and cid sequence at for this patent did not appear in the printed sequence data for this patent did not appear in the printed set in the form which is the contact of the second sequence data for this patent did not appear in the printed set for this patent did not appear in the printed set for this patent did not appear in the printed set for this patent did not appear in the printed set for this patent did not appear in the printed set for this patent did not appear in the printed set for this patent did not appear in the printed set for the set for this patent did not appear in the printed set for the set for this patent did not appear in the printed set for the set
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    18;

The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques (C io. identifying expressed genes. (I) is useful in gene therapy techniques (C ii). (II) is useful for generating antibodies against it, detecting or guantitating a polypeptide in tissue, as molecular weight markers and as inogolar protein and its binding partners are useful in medical clisorders involving abereat protein expression or biological activity. (I magnostics, forensics, gene mapping, identification of mutations in responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences of the invention.

C diagnostic amino acid sequences of the invention.

C Note: The sequence data for this patent did not appear in the printed cat fire. who, int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  18;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 150 DSSAAKNDDQQSSKKNTTAKLNKDAENVVKKAGI----DPNSLTDDQIKALNKMNFSKAAK 206

(I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromo and gene mapping, and in recombinant production of (II). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

Cc for identifying expressed genes. (I) is useful in gene therapy techniques of to restore normal activity of (II) or to treat disease states involving cc (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as imaging of suppeptide in tissue, as molecular weight markers and as imaging of suppeptide in tissue, as molecular weight markers and as imaging of sites expressing (II). (I) and its binding partners are useful in medical disorders involving aberrant protein expression or biological activity. (C diagnostics, forensics, gene mapping, identification of mutations in capponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences and products dependent on DNA and diagnostic amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed capporation; but was obtained in electronic format directly from WIPO vy
                                                                                                                                                                                                                                                                                                                                                                                                          25;

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome olymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The control of                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    printed

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The analysing expressed generation (FCR) primers, oligomers, and for chromosome operation of (II) and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags to restore normal activity of (II) or to treat disease states involving contribution and its binding partners are useful in medical afood supplement. (II) and its binding partners are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in the polypeptide and polynucleotide sequences have applications in responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences of the invention.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The and gene mapping a also used in diagnostics as expressed sequence tags (or identifying expressed genes. (I) is useful in gene therapy techniques of the commal activity of (II) or to treat disease states involving (I). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as function of sites expressing (II). (I) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in capponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostics amino acid sequences of the invention.

Companies of the companies of the invention.

Companies of the companies of the printed or specification, but was obtained in electronic format directly from WIPO are format directly from WIPO.
New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity |\cdot\>
```

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                          The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes,
                                                                                                                                                                                                                                                                                                                                    Claim 20; SEQ ID No 56128; 103pp; English.

polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerisestates are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques (I) restore normal activity of (II) is useful in gene therapy techniques (II) (II) is useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical mading of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. (I per produce other types of data and products dependent on partners are assess biodiversity and or genetic disorders or other traits to assess biodiversity and ocid sequences. Association and products dependent on DNA and diagnostic amino acid sequences of the invention.

Combined and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences of the invention.

Claim 20; SEQ ID No 52006; 103pp; English.

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, collypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The collynucleotides are also used in diagnostics as expressed agenected for indiagnostics as expressed agenected for its useful in gene therapy techniques (I) constone normal activity of (II) or to treat disease states involving quantitating a polypeptide in tissue, as molecular weight markers and as imaging of sites expressing (II). (I) and its binding pattners are useful in medical disorders involving aberrant protein expression or biological activity. (I) and its binding pattners are useful in medical disorders involving aberrant protein expression or biological activity. (I) and its binding pattners are useful in medical disorders involving aberrant protein expression or biological activity. (I) and its binding pattners are useful in medical disorders or produce other treating and (II). (I) and (II) are useful for treating content treations in responsible for genetic disorders or other traits to assess biodiversity amino acid sequences. Abg000010-ABG30377 represent nowel human or diagnostic amino acid sequences of the invention.

Novel human diagnostic protein #21638.

18-FEB-2002 (first entry)

ABG21647 standard; Protein; 493

diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences. ABG00010-ABG30377 represent novel human Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences.

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

Claim 20; SEQ ID No 52191; 103pp; English.

biodiversity

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerses chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical aforders involving aborates involving disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in

Sequence 2, Application US/08943374

Patent No. 602849

GENERAL INFORMATION:
APPLICANT: ROBER, Manuela
APPLICANT: GEIER, Gebhardt
APPLICANT: GEIER, Klaus
APPLICANT: WILMATIZER, Lothar
TITLE OF INVENTION: formation of polyfructans (levans), plasmids containing
TITLE OF INVENTION: tress sequences as well as a process for preparing
NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                         22;
                                                                                                                                                                                                                                                                                                         257 EPLDVWDSWPVQDVRTGQVANWNGYQLVIAMMGIPN-----QNDNHIYLL----YNKYG 306
